The present invention relates to a class of indazole-substituted five-membered heteroaromatic compounds which act on 5-hydroxytryptamine (5-HT) receptors, being specific agonists of so-called "5-HT<sub>1</sub>-like" receptors. They are therefore useful in the treatment of clinical conditions for which a selective agonist of these receptors is indicated.

5-HT<sub>1</sub>-like receptor agonists which exhibit selective vasoconstrictor activity have recently been described as being of use in the treatment of migraine (see, for example, A. Doenicke *et al.*, *The Lancet*, 1988, Vol. 1, 1309-11). The compounds of the present invention, being specific 5-HT<sub>1</sub>-like receptor agonists, are accordingly of particular use in the treatment of migraine and associated conditions, e.g. cluster headache, chronic paroxysmal hemicrania and headache associated with vascular disorders.

EP-A-0313397 describes a class of tryptamine derivatives substituted by a five-membered heteroaliphatic ring, which are stated to act as specific agonists of a particular type of "5-HT<sub>1</sub>-like" receptor and thus to be effective therapeutic agents for the treatment of clinical conditions, particularly migraine, requiring this activity. However, EP-A-0313397 neither discloses nor suggests the heteroaromatic compounds provided by the present invention.

EP-A-0328200 describes a class of 5-membered heterocyclic compounds having at least one heteroatom, substituted on the heterocyclic ring by an azacyclic or azabicyclic ring system or an amino substituent. These compounds are stated to be useful in the treatment of psychotic disorders (e.g. schizophrenia and mania); anxiety; alcohol or drug withdrawal; pain; gastric stasis; gastric dysfunction; migraine, nausea and vomiting; and presenile and senile dementia. However, they have no action on the 5-HT<sub>1</sub>-like receptors of which the heteroaromatic compounds of the present invention are specific agonists, and therefore elicit their effect by a different mechanism.

The present invention provides a compound of formula I, or a salt or prodrug thereof:

55 The invention also provides pharmaceutical compositions comprising one or more compounds of this invention in association with a pharmaceutically acceptable carrier. Preferably these compositions are in unit dosage forms such as tablets, pills, capsules, powders, granules, sterile parenteral solutions or suspensions, or suppositories, for oral, parenteral or rectal administration. For preparing solid compositions such as tablets, th

principal active ingredient is mixed with a pharmaceutical carrier, e.g. conventional tableting ingredients such as corn starch, lactose, sucrose, sorbitol, talc, stearic acid, magnesium stearate, dicalcium phosphate or gums, and other pharmaceutical diluents, e.g. water, to form a solid preformulation composition containing a homogeneous mixture of a compound of the present invention, or a non-toxic pharmaceutically acceptable salt thereof. When referring to these preformulation compositions as homogeneous, it is meant that the active ingredient is dispersed evenly throughout the composition so that the composition may be readily subdivided into equally effective unit dosage forms such as tablets, pills and capsules. This solid preformulation composition is then subdivided into unit dosage forms of the type described above containing from 0.1 to about 500 mg of the active ingredient of the present invention. The tablets or pills of the novel composition can be coated or otherwise compounded to provide a dosage form affording the advantage of prolonged action. For example, the tablet or pill can comprise an inner dosage and an outer dosage component, the latter being in the form of an envelope over the former. The two components can be separated by an enteric layer which serves to resist disintegration in the stomach and permits the inner component to pass intact into the duodenum or to be delayed in release. A variety of materials can be used for such enteric layers or coatings, such materials including a number of polymeric acids and mixtures of polymeric acids with such materials as shellac, cetyl alcohol and cellulose acetate.

The liquid forms in which the novel compositions of the present invention may be incorporated for administration orally or by injection include aqueous solutions, suitably flavoured syrups, aqueous or oil suspensions, and flavoured emulsions with edible oils such as cottonseed oil, sesame oil, coconut oil or peanut oil, as well as elixirs and similar pharmaceutical vehicles. Suitable dispersing or suspending agents for aqueous suspensions include synthetic and natural gums such as tragacanth, acacia, alginate, dextran, sodium carboxymethylcellulose, methylcellulose, polyvinylpyrrolidone or gelatin.

In the treatment of migraine, a suitable dosage level is about 0.01 to 250 mg/kg per day, preferably about 0.05 to 100 mg/kg per day, and especially about 0.05 to 5 mg/kg per day. The compounds may be administered on a regimen of 1 to 4 times per day.

The oxadiazole compounds of this invention may be prepared by a process which comprises reacting a reactive derivative of a carboxylic acid of formula  $R^c\text{-CO}_2\text{H}$  with a compound either of formula III or of formula IV, or a salt thereof:

wherein one of  $R^c$  and  $R^d$  is a group of formula A, and the other is a group of formula -E-F, as defined with reference to formula I above.

Suitable reactive derivatives of the acid  $R^c\text{-CO}_2\text{H}$  include esters, for example  $C_{1-4}$  alkyl esters; thioesters, for example pyridylthioesters; acid anhydrides, for example  $(R^c\text{CO})_2\text{O}$ ; acid halides, for example acid chlorides; orthoesters; and primary, secondary and tertiary amides.

A preferred reactive derivative of the acid  $R^c\text{-CO}_2\text{H}$  is the iminoether derivative of formula V:

where R is  $C_{1-4}$  alkyl.

When the compound of formula III is employed the product of the reaction is a 1,2,4-oxadiazole. It will be

appreciated that the compound III can also be considered as the alternative tautomeric form IIIA:

wherein  $\text{R}^d$  is as defined above.

A 3-substituted-1,2,4-oxadiazol-5-yl compound is produced if  $\text{R}^e$  represents a group -E-F and  $\text{R}^d$  in formula III represents a group A; whereas a 5-substituted-1,2,4-oxadiazol-3-yl compound is produced by the process of this invention when  $\text{R}^e$  represents a group A and  $\text{R}^d$  represents a group -E-F. A preferred reactive derivative of the acid  $\text{R}^e\text{-CO}_2\text{H}$  in this case is a  $\text{C}_{1-4}$  alkyl ester. The reaction is conveniently carried out in the presence of a strong base, e.g. sodium hydride, using a suitable solvent, for example tetrahydrofuran, dimethylformamide or a lower alkanol such as ethanol, propanol or isopropanol, at about 20°C to 100°C for about 1 to 6 hours.

When the compound of formula IV is employed, the product of the process of this invention is a 1,3,4-oxadiazole. In this case, a preferred reactive derivative of the acid  $\text{R}^e\text{-CO}_2\text{H}$  is an orthoester of formula  $\text{R}^e\text{C(OR}^p)_3$  where  $\text{R}^p$  represents  $\text{C}_{1-3}$  alkyl. The process is conveniently effected by heating the hydrazide IV with the orthoester in a solvent such as methanol at reflux temperature for about 2 to 8 hours. An intermediate of formula  $\text{R}^d\text{.CO.NH.N=C(R}^e\text{)OR}^p$  may be isolated by evaporation of the solvent. The intermediate is then treated with a strong base such as potassium *t*-butoxide or 1,8-diazabicyclo[5.4.0]undec-7-ene, in butanol for about 10 to 24 hours at about 90°C to 150°C.

The reactive derivative of a carboxylic acid of formula  $\text{R}^e\text{-CO}_2\text{H}$  or the compound of formula III or IV, wherein  $\text{R}^e$  or  $\text{R}^d$  represents a group of formula -E-F, may be prepared by the cyclisation of a compound of formula VI:

wherein Q represents a reactive carboxylate moiety, or a group of formula  $\text{-C(NOH)NH}_2$  or  $\text{-CONHNH}_2$  or a protected derivative thereof or precursor thereto; E and  $\text{R}^1$  are as defined above; and D represents a readily displaceable group; followed, where required, by N-alkylation by standard methods to introduce the moiety  $\text{R}^3$ .

The cyclisation of compound VI is conveniently achieved in a suitable organic solvent at an elevated temperature, for example in a mixture of *m*-xylene and 2,6-lutidine at a temperature in the region of 140°C; or in the melt, which requires a temperature of approximately 170°C.

When the moiety Q in the compounds of formula VI represents a precursor to a group of formula  $\text{-C(NOH)NH}_2$  or  $\text{-CONHNH}_2$ , this group is suitably a nitrile group.

The readily displaceable group D in the compounds of formula VI suitably represents a  $\text{C}_{1-4}$  alkanoyloxy group, preferably acetoxy, or an arylsulphonyl group such as *p*-toluenesulphonyl (tosyl). Where D in the desired compound of formula VI represents acetoxy, this compound may be conveniently prepared by treating a carbonyl compound of formula VII:

(VII)

wherein  $R^1$ , E and Q are as defined above; or a protected derivative thereof; with hydroxylamine hydrochloride, advantageously in pyridine at the reflux temperature of the solvent; followed by acetylation with acetic anhydride, advantageously in the presence of 4-dimethylaminopyridine, in dichloromethane at room temperature.

The N-formyl protected derivative of the intermediate of formula VII may be conveniently prepared by ozonolysis of an indole derivative of formula VIII:

(VIII)

wherein  $R^1$ , E and Q are as defined above; followed by a reductive work-up, advantageously using dimethylsulphide.

The indole derivatives of formula VIII may be prepared by methods analogous to those described in the accompanying Examples, or by procedures well known from the art.

The 1,2,4-thiadiazoles of formula I may be prepared by a process which comprises the cyclisation of a compound of formula IX:

(IX)

wherein  $R^c$  and  $R^d$  are as defined above, and  $R^e$  is hydrogen or an alkyl group.

Cyclisation of compound IX can be achieved using an aminating agent such as hydroxylamine-O-sulphonic acid in a lower alkanol such as methanol, ethanol or propanol, in the presence of pyridine, at between  $-20^\circ\text{C}$  and  $50^\circ\text{C}$  for about 1-6 hours.

Cyclisation of compounds of formula IX in which  $R^e$  is hydrogen may also be achieved by use of an oxidising agent such as bromine, iodine, hydrogen peroxide or nitric acid.

The compounds of formula IX above may be prepared by the processes described in Comprehensive

Heterocyclic Chemistry, ed. A.R. Katritzky and C.W. Rees, Pergamon Press, 1984, Vol. 6, p. 496, or by methods analogous thereto.

The 1,2,4-thiadiazoles may also be prepared by cycloaddition of a nitrile sulphide  $R^c-C\equiv N^+-S^-$  with a nitrile of formula  $R^d-CN$  where  $R^c$  and  $R^d$  are as defined above.

1,3,4-Thiadiazoles of this invention may be prepared by dehydration of a thiosemicarbazide of formula  $R^cCSNHNHCONR^d$ , where  $R^c$  is as defined above and  $R^d$  are hydrogen or an alkyl group, with a dehydrating agent such as sulphuric acid, polyphosphoric acid or methanesulphonic acid; followed by attachment of the  $R^d$  group by conventional means.

1,2,5-Thiadiazoles of this invention may be prepared by reacting a diamine of the type

where  $R^c$  and  $R^d$  are as defined above, with a sulphur chloride such as thionyl chloride or sulphur dichloride.

The oxazoles and thiazoles of this invention may be prepared by reaction of an amide or thioamide of formula X with a  $\alpha$ -haloketone of formula XI:

(X)

(XI)

wherein U is oxygen or sulphur, Hal represents halogen, and  $R^c$  and  $R^d$  are as defined above. The conditions for this reaction are as described in Synthesis, 1975, 389.

Furans possessing a 2,5-substitution pattern may, for example, be prepared by treating a compound of formula XII:

(XII)

wherein  $R^d$  is as previously defined; with a reagent capable of generating an anion thereof by abstraction of the proton adjacent to the oxygen atom; and subsequently reacting the anionic species thereby obtained with an electrophilic species capable of providing the moiety  $R^c$ , wherein  $R^c$  is as previously defined.

The reagent capable of generating an anion of the compound of formula XII by abstraction of the proton adjacent to the oxygen atom is suitably an alkyl lithium, e.g. n-butyllithium.

The electrophilic species capable of providing the moiety  $R^c$  is suitably a carbonyl-containing compound or a compound of formula  $R^c-L$ , in which L represents a suitable leaving group such as halogen atom, e.g. chlorine or bromine. In the former case, the compound obtained from reaction of the carbonyl compound with the anion derived from compound XII will contain a hydroxy moiety as part of the resulting  $R^c$  group. This hydroxy moiety may, if desired, be retained intact, or may be removed by standard procedures, for example elimination with  $POCl_3$  followed by hydrogenation.

Illustrative experimental details for performing the above process are, for example, described in J. Med. Chem., 1990, **33**, 1128.

The intermediate of formula XII may be prepared by conventional methods, for example:

wherein  $R^d$  is as defined above.

15 In an alternative process, the compounds according to the invention may be prepared by a method which comprises reacting a compound of formula XIII:

25 (XIII)

with a reagent which provides an anion  $R^c$ , where W, X, Y, Z,  $R^c$  and  $R^d$  are as previously defined and Hal represents halogen.

30 Compound XIII may be prepared by conventional procedures known from the art. For example, if compound XIII is a 1,2,4-thiadiazole, this compound may be prepared by the general method described in Chem. Ber., 1957, **90**, 182.

35 Reagents which may provide the anion  $R^c$  include Grignard reagents  $R^cMgHal$  (where Hal = halogen); organocuprate reagents such as  $LiR^c_2Cu$ ; organolithium reagents  $R^cLi$ ; or compounds which stabilise the anion by means of an adjacent activating group such as an ester or enolisable ketone function. In this case, the adjacent ester or ketone function may be retained after the process is complete, or may be removed. For example, an ester moiety may be hydrolysed and decarboxylated.

40 In a further process, the compounds according to the invention may be prepared by a method which comprises cyclising a compound of formula XIV:

(XIV)

55 wherein W, X, Y, Z, A, E,  $R^1$  and D are as defined above; followed, where required, by N-alkylation by standard methods to introduce the moiety  $R^3$ .

As with the cyclisation of compound VI, that of compound XIV is conveniently achieved in a suitable organic solvent at an elevated temperature, for example in a mixture of m-xylene and 2,6-lutidine at a temperature in the region of 140°C; or in the melt.

The compounds of formula XIV may, for example, be prepared from the corresponding compound of formula XV:

(XV)

wherein W, X, Y, Z, A, E and R<sup>1</sup> are as defined above; or a protected derivative thereof; which in turn may be prepared from the corresponding compound of formula XVI:

(XVI)

wherein W, X, Y, Z, A, E and R<sup>1</sup> are as defined above; using methods analogous to those described above with reference to the compounds of formulae VII and VIII. Thus, for example, when e in the compounds of formula VIII represents a group of formula -C(NOH)NH<sub>2</sub> or -CONHNH<sub>2</sub>, the compounds of formula XVI may be prepared therefrom by reaction with a reactive derivative of a carboxylic acid of formula A-CO<sub>2</sub>H, where A is as defined previously. Alternatively, when Q in the compounds of formula VIII represents a reactive carboxylate moiety, the compounds of formula XVI may be prepared therefrom by reaction with a compound of formula A-C(NOH)NH<sub>2</sub> or A-CONHNH<sub>2</sub>.

The compounds of formula Q-E-F, wherein Q, E and F are as defined above, and salts and prodrugs thereof, are novel compounds in their own right, and accordingly represent a further feature of the present invention. A particular subgroup of such compounds is represented by the compounds of formula Q<sup>1</sup>-E-F, wherein E and F are as defined above and Q<sup>1</sup> represents a C<sub>1-4</sub> alkyl ester group; and salts and prodrugs thereof. Particularly preferred compounds in this context are 2-(5-ethoxycarbonyl-1H-indazol-3-yl)ethylamine; 2-(5-ethoxycarbonylmethyl-1H-indazol-3-yl)ethylamine; N,N-dimethyl-2-(5-methoxycarbonylmethyl-1H-indazol-3-yl)ethylamine; and salts and prodrugs thereof.

It will be appreciated that any compound of formula I initially obtained from any of the above processes may, where appropriate, subsequently be elaborated into a further compound of formula I by techniques known from the art. In particular, a compound of formula I wherein R<sup>3</sup> is hydrogen initially obtained may be converted into a compound of formula I wherein R<sup>3</sup> represents C<sub>1-6</sub> alkyl, C<sub>2-6</sub> alkenyl or C<sub>2-6</sub> alkynyl by standard techniques such as alkylation, for example by treatment with an alkyl iodide, e.g. methyl iodide, typically under basic conditions, e.g. sodium hydride in dimethylformamide. Similarly, a compound of formula I wherein R<sup>1</sup> represents a group of formula -CH<sub>2</sub>.CHR<sup>4</sup>.NH<sub>2</sub> initially obtained may be converted into a compound of formula I wherein R<sup>1</sup> represents a group of formula -CH<sub>2</sub>.CHR<sup>4</sup>.NR<sup>x</sup>R<sup>y</sup> in which R<sup>x</sup> and R<sup>y</sup> are as defined above with the exception of hydrogen, for example by conventional N-alkylation or N-arylation techniques, e.g. by treatment with the appropriate aldehyde in the presence of a reducing agent such as sodium cyanoborohydride.

Where the above-described processes for the preparation of the compounds according to the invention give rise to mixtures of stereoisomers, these isomers may be separated by conventional technique such as

preparative chromatography.

The novel compounds may be prepared in racemic form, or individual enantiomers may be prepared either by enantiospecific synthesis or by resolution. The novel compounds may, for example, be resolved into their component enantiomers by standard techniques, such as the formation of diastereomeric pairs by salt formation with an optically active acid, such as (-)-di-p-toluoyl-d-tartaric acid and/or (+)-di-p-toluoyl-1-tartaric acid followed by fractional crystallization and regeneration of the free base. The novel compounds may also be resolved by formation of diastereomeric esters or amides, followed by chromatographic separation and removal of the chiral auxiliary.

During any of the above synthetic sequences it may be necessary and/or desirable to protect sensitive or reactive groups on any of the molecules concerned. This may be achieved by means of conventional protecting groups, such as those described in *Protective Groups in Organic Chemistry*, ed. J.F.W. McOmle, Plenum Press, 1973; and T.W. Greene, *Protective Groups in Organic Synthesis*, John Wiley & Sons, 1981. The protecting groups may be removed at a convenient subsequent stage using methods known from the art.

The following Examples illustrate the preparation of compounds according to the invention.

The ability of test compounds to bind to 5-HT<sub>1</sub>-like receptors was measured in membranes prepared from pig caudate using the procedure described in *J. Neurosci.*, 1987, 7, 894. Binding was determined using 2 nM 5-hydroxytryptamine creatinine sulphate, 5-[1,2-<sup>3</sup>H(N)] as a radioligand. Cyanopindolol (100 nM) and mesulergine (100 nM) were included in the assay to block out 5-HT<sub>1A</sub> and 5-HT<sub>1C</sub> binding sites respectively. The concentration of the compounds of the accompanying Examples required to displace 50% of the specific binding (IC<sub>50</sub>) is below 1 µM in each case.

The activity of test compounds as agonists of the 5-HT<sub>1</sub>-like receptor was measured in terms of their ability to mediate contraction of the saphenous vein of New Zealand White rabbits, using the procedure described in *Arch. Pharm.*, 1990, 342, 111. Agonist potencies were calculated as -log<sub>10</sub>EC<sub>50</sub> (pEC<sub>50</sub>) values, from plots of percentage 5-HT (1 µM) response against the concentration of the agonist. The compound of accompanying Example 2 was tested and was found to possess a pEC<sub>50</sub> value in this assay of not less than 5.0.
